

Application maintenance on Unisys Mainframe environment

The Client

The customer is a large building society. It offers a broad range of retail financial services including mortgages, savings, current accounts, life assurance and investment products, personal loans and household insurance.

The Challenge

The existing application was written on legacy COBOL running on a Unisys Mainframe environment. The application required changes as part of application maintenance.

The Solution

This project involved carrying out a number of changes to the COBOL code running on a Unisys Mainframe. Some of the changes incorporated include automation of the determination of the Batch Date, conversion from open reel tape to disc for SPLITAPE processing, amending all answerable messages using CONMESS and message rationalization.

The Benefits

This assignment was undertaken as pilot for the Euro conversion project and the customer requirements were successfully fulfilled on time.
