

## Financial management system

### The Client

The customer is a leading application service provider to financial services companies in the US.

### The Challenge

Customer required a financial management system with an automated data collection and reporting system with the ability to analyze and monitor compliance with relevant governmental fiscal mandates.

### The Solution

Our team delivered a comprehensive web based application developed using Microsoft .NET technology. The GUI was based on ASP.NET and business logic was implemented using VB.NET. The application communicates to a central MS SQL Server database, using ADO.NET. The system implemented role based access allowing only authorized users to login to the system and access FMS information according to their profile.

### The Benefits

- The systems implemented an easy to use browser based user interface and an automated workflow management system
- The pages were dynamically constructed based on assembling UI components at runtime making it easier to maintain them. The layout could be changed easily by modifying the base layout without changing the UI components.
- Based on the workflow management system, multi-level approval process was automated.

### The Technology

.NET, ASP.NET, VB.NET, ADO.NET.
